

## **JS TASK**

Q. List down ways in which JavaScript command can be added to a webpage, what is the preferred way.

Different types of ways:

**1. Embedding code**

Adding the JavaScript code between a pair of `<script>...</script>` tag.

**2. Inline code**

Placing JavaScript code directly inside HTML tags using some special attributes.

**3. External file**

Making a separate JavaScript file having .js as an extension.

The preferred way to add javascript in webpage is External file. Making a external file With extension .js and linking this file with html file with the help of `<script>` `</script>` tag. All script is separated from the html file, So it provides easy to maintain the code and also other developers can understand the code.
